

Nubian Skin

Recovering an at-risk customer before renewal.

Cora / Growth Plan / Month 6 of 12

The case

Nubian Skin is six months into a 12-month contract. Although renewal is still six months away, declining adoption, operational friction and weaker engagement indicate that intervention is needed now. The first 90 days focus on recovery; the following 90 days provide time to sustain the improvement and establish renewal readiness.

VALUE

RENEWAL

01 / CUSTOMER

A beauty store using Cora to manage orders, inventory, payments and fulfilment across its sales channels.

THE ACCOUNT

Nubian Skin has been using Cora for six months on the Growth plan. The original business goal was straightforward: reduce manual order handling, improve inventory accuracy and give the team one place to manage customer operations.

PLAN	Growth — ₦35,000 / month
CONTRACT VALUE	₦420,000 annually
USERS	8 licensed users
RENEWAL	6 months
CSM	Monica

Stakeholders

Stacia Johnston
Product Manager / Champion

Daniel Okafor
IT & Systems Lead / Technical

Amaka Bello
Operations Lead

My responsibility
Own the relationship, coordinate the recovery and keep the work tied to customer outcomes.

02 / CURRENT STATE

What is happening right now?

The account has not churned. But the signals are moving in the wrong direction at the same time.

48 / 100

HEALTH SCORE: AT RISK

Cora health model

Adoption & Usage: 60%
Support: 25%
Relationship Signal: 15%

SIGNAL	EARLIER	CURRENT	WHY I CARE
Weekly active users	7 / 8	4 / 8	Adoption
Orders through Cora	90%	62%	Workflow
Inventory discrepancies	2 / month	7 / month	Accuracy
Support tickets	2 / month	8 / month	Friction
NPS	8 / 10	5 / 10	Sentiment
CSM engagement	Monthly	2 meetings missed	Relationship

My first conclusion There is enough evidence to intervene but not enough evidence yet to call the cause.

03 / INVESTIGATION

What I needed to establish.

The first priority was to understand what was actually driving the decline before recommending an intervention.

I would start with three conversations.

WITH DANIEL — TECHNICAL

I assessed whether configuration issues, integrations, or technical friction were contributing to the increase in operational problems and reduced usage. What changed in the configuration recently? Is this a one-time bug or a systemic sync issue? Has anything on the integration side shifted? This tells me whether the root cause is technical debt or a genuine defect.

WITH AMAKA — OPERATIONS

I examined how the team was using Cora day-to-day, where manual workarounds had appeared, and whether workflow changes were affecting adoption. Where exactly are they leaving Cora? What are they doing manually? What part of the workflow feels unreliable or difficult? This tells me whether the problem is process, usability or confidence.

WITH STACIA — CHAMPION

I reviewed whether Nubian Skin's priorities had changed, how they were measuring value, and whether the decline in engagement reflected a broader change in expectations or ownership. Are business priorities different? Does she still believe Cora is helping them achieve the goals they bought it for? This protects me from treating an operational problem as purely a product problem.

The objective here is to distinguish between a technical problem, process problem, adoption gap, training need, or business change before deciding on the recovery action.

04 / DIAGNOSIS

What is driving the risk?

The working diagnosis is a configuration problem that has created an operational workaround and then weakened adoption.

CONFIGURATION

Inventory/order sync is not behaving reliably.

01	The workflow breaks	Inventory does not update reliably after some orders.
02	Operations protect the business	The team returns to spreadsheets rather than risk fulfilment errors.
03	Trust in the product falls	Fewer users rely on Cora for the complete workflow.
04	Customer health declines	Support volume, sentiment and engagement deteriorate.

This is why I will not lead with another generic training session. The workflow has to be reliable before I ask the team to adopt it again.

05 / RECOVERY — DAYS 1–30

Stabilise the Account

The objective here is to understand the root cause, align stakeholders, resolve the immediate blocker, and establish a reliable baseline for recovery.

01

WEEK 1

Align & Diagnose

- Meet with Stacia to understand priorities, concerns and expectations.
- Meet with Amaka to review day-to-day operations and workarounds.
- Meet with Daniel to assess technical/configuration issues.
- Review support tickets, usage trends and missed engagements to identify the root cause.

02

WEEKS 1–2

Escalate & Communicate

- Escalate confirmed technical or configuration issues to the appropriate Cora team.
- Establish a clear owner and resolution timeline.
- Send Stacia and Daniel a written update with next steps and ownership.
- Maintain proactive communication so the customer does not need to chase for updates.

03

WEEKS 2–3

Fix & Validate

- Work with the technical team to resolve the configuration issue.
- Test the fixed workflow with Daniel and relevant users.
- Run UAT with Nubian team to confirm the solution works in their day-to-day process.
- Identify remaining gaps that are training or adoption related.

04

WEEK 4

Enable & Establish Baseline

- Deliver targeted training based on identified gaps.
- Provide use-case support for key workflows.
- Establish recovery baselines: WAU, % of orders through Cora, inventory discrepancies, support tickets and stakeholder engagement.
- Confirm with Stacia and Amaka that the team is comfortable using the platform.

KEY OUTCOME BY DAY 30: The blocker is addressed, stakeholders are aligned, the workflow is validated, and the account is ready to move into adoption recovery.

06 / RECOVERY — DAYS 31–60

Rebuild adoption

With the core workflow stabilised, the recovery moved into sustained adoption and consistent use across the team.

Adoption Signals to watch out for.

Weekly active users	Are the 4 inactive users returning?
Order share	Are more orders staying inside Cora?
Manual work	Is the spreadsheet workaround disappearing?
Support	Are inventory-related tickets falling?

CUSTOMER CADENCE

Weekly

Short adoption / blocker check-in

Biweekly

Once the account is stable enough

Monthly

Value / progress conversation

The cadence moved from weekly recovery check-ins toward bi-weekly progress reviews as the account stabilised. The Day-60 review confirmed the priorities for the final value phase.

07 / RECOVERY — DAYS 61–90

Demonstrate value before renewal

The final phase connected product adoption to the business outcomes Nubian Skin originally expected from Cora.

OPERATIONS

Order management was assessed for reduced friction and greater consistency.

EFFICIENCY

Manual administration was assessed against the recovery baseline.

EXPERIENCE

Inventory accuracy and customer experience were assessed for measurable improvement.

DAY-90 REVIEW

Weekly Active Users	4 → 7
Orders through Cora	62% → 90%+
Inventory discrepancies	7 → <2 / month
Support Ticket	8/month → <2/month
NPS	5 → 8 / 10
CSM engagement	2 meetings missed → Monthly cadence restored

The Day-90 review brought the before-and-after evidence together, confirmed the remaining priorities and established the next 90 days of value reinforcement before renewal.

08 / STAKEHOLDERS

How each stakeholder was managed

Each stakeholder had a distinct role in the recovery, so engagement was tailored to the information and decisions they owned.

STACIA JOHNSTON Product Manager / Champion	Stacia owned the strategic view of value and customer priorities. Engagement focused on business outcomes, recovery progress and whether Cora remained aligned with Nubian Skin’s goals.
DANIEL OKAFOR IT & Systems Lead	Daniel provided the technical facts: What was failing, what had changed, what had been fixed, and what still needed attention. He was the bridge between the Nubian’s technical environment and our technical team.
AMAKA BELLO Operations Lead	Amaka provided the operational view of the workflow. She validated the corrected process in practice and identified any remaining reliance on spreadsheets or manual workarounds.

Relationship continuity: Stacia remained the primary champion, while Amaka and Daniel provided additional operational and technical visibility as engagement was rebuilt.

09 / ADOPTION & VALUE

How adoption and value were measured

Adoption was measured through behaviour change, not login activity alone: consistent use of Cora for the workflows that matter to the business.

ADOPTION

What recovery looked for five behaviour changes:

- More users completing the core order workflow in Cora.
- A higher percentage of orders processed through Cora.
- Less reliance on spreadsheets and manual reconciliation.
- Fewer support issues tied to the same workflow.
- Operations users able to complete the process without CSM intervention.

VALUE

The customer bought Cora to improve:

Order management	90%+ of orders in Cora
Operational efficiency	<1 hour/day manual admin
Inventory accuracy	≤2 discrepancies/month
Customer experience	NPS trending back toward 8

The value review connects these measures back to the customer's original goals.

10 / RENEWAL

Is Nubian Skin ready for renewal?

Renewal readiness was based on demonstrated value and sustained account health—not simply the approaching contract end date.

RENEWAL READINESS

01	Technical issue resolved	The customer can complete the core workflow reliably.
02	Adoption recovered	Usage and order share show sustained improvement.
03	Operational value visible	Manual work and inventory issues have reduced.
04	Relationship restored	The champion and operational stakeholders are engaged.
05	Value reviewed	The customer can connect Cora to the goals they bought it for.

Expansion signal after core health is restored: Additional stores, locations or users could create an expansion opportunity after the core account is healthy and the original value has been demonstrated.

The point of the recovery is not a green Health Score.

It is a customer who can confidently say:

“Cora is helping us run the business better.”

Observe → Investigate → Diagnose → Intervene → Measure → Review
